Research Focus

I am broadly interested in how the human body senses external stimuli, conveys this signal to the brain and generates responses via neuronal ion channels, such as how we detect and respond to different temperatures. To address these fundamental questions, our lab uses a diverse set of biophysical approaches to study the structure and function of these important ion channels, including cryo-electron microscopy (Cryo-EM) and patch-clamp electrophysiology. Our long-term goals include understanding temperature sensation and regulation in the human body and structure-guided drug design relevant to mental illness, pain therapy, and temperature-related pathological conditions.
